Abstract

- This project focuses on the design and implementation of a comprehensive quiz application employing CRUD (Create, Read, Update, Delete) concepts to manage quiz-related entities. The primary entities in the system include quizzes, questions, options, and users.
- The CRUD operations are systematically integrated into the application, allowing users to create new quizzes, questions, and options. The read operation facilitates the display of quizzes, their details, and user-specific quiz history. The update operation enables users to edit quiz content, question text, and option text, while the delete operation permits the removal of quizzes, questions, and options with appropriate confirmation mechanisms in place.

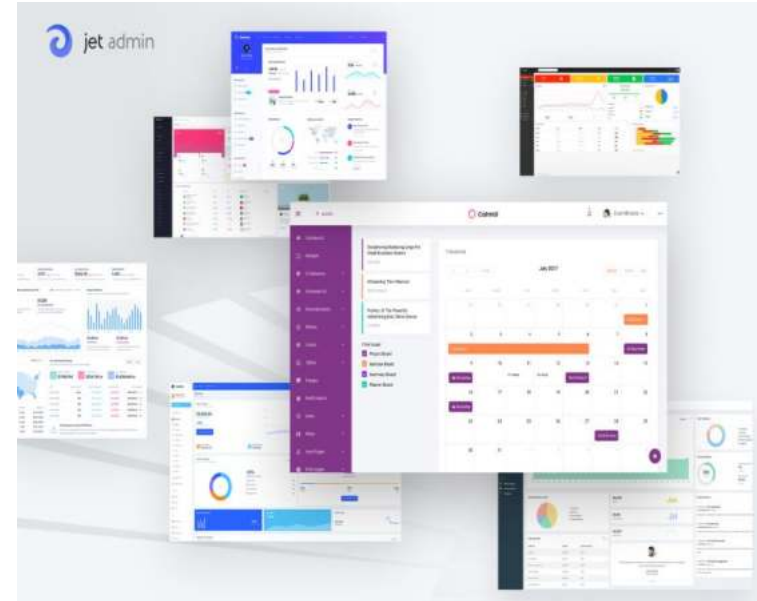

Problem Statement

- In the realm of digital education and engagement, there is a growing need for interactive and accessible tools that enhance learning and assessment experiences. Traditional methods of quiz delivery often lack engagement, adaptability, and real-time feedback, leading to diminished interest and effectiveness in learning environments.
- To address this gap, the development of a dynamic website quiz application is proposed. This application aims to provide an engaging, user-friendly, and versatile platform for a wide range of users, including educators, students, and individuals seeking self-assessment tools.

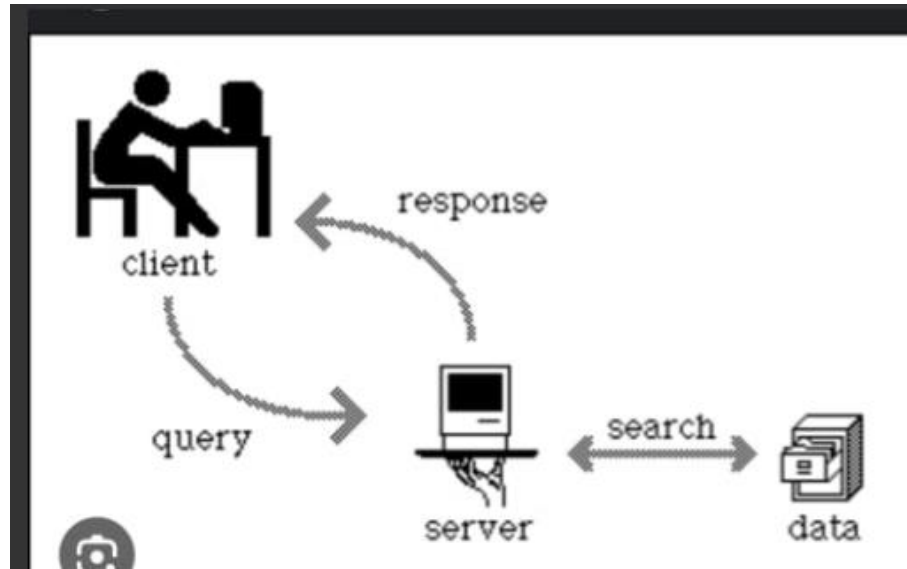

Proposed Solution

- We aim to counteract these problems by building a quiz based application website.
- The website will have two types of login options either the new member can login as admin or as user.
- Both the user and admin have various functions that can be performed in website such as the admin has access to perform actions as adding quiz questions in website, deleting the questions, updating the questions and filtering the students based on their performance. The user can select domain, attempt quiz and can check score.

Algorithm & Deployment

Conclusion

- The development of a quiz application website represents a significant stride in enhancing interactive learning and assessment.
- The application's design prioritizes user engagement and ease of use, ensuring accessibility across various devices and platforms. Key features such as customizable quizzes, a variety of question types and performance tracking.
- It serves as a versatile and valuable resource for both knowledge acquisition and evaluation, promising to evolve continually in response to the changing landscapes of technology and education

Future Scope

- Advanced Analytics and Reporting
- Collaboration Tools for Educators
- Content Expansion
- Corporate Training and Professional Development
